### eCall/ERA-GLONASS E2E Conformance Testing

8<sup>th</sup> June 2017

**Rob Short** 

# The autonomous car vs. eCall / ERA-GLONASS

The car will take the control and responsibility from the driver, and controls all tasks and decisions autonomously!

# eCall / ERA-GLONASS system overview Today

A manually or automatically initiated emergency call and a transmission of an MSD from an IVS to PSAP via the voice channel through the cellular network.

# Todays emergency call systems for vehicles The Key-component

**IVS:** The **in-vehicle system** is an in-band modem which consists of a modem that operates full-duplex and allows reliable MSD transmission to the PSAP via the voice channel through the cellular network.

The eCall in-band modem uses for data transmission of the MSD the same voice channel as used for the emergency voice calls.

# eCall/ERA-GLONASS conformance test setup

# R&S eCall / ERA-GLONASS test setup R&S CMW500 Communication Tester

COMPANY RESTRICTED

#### Key Features:

- All-in-one test platform for wireless devices
- Supported Technologies:
  - ■GSM/EGPRS//EDGE Evolution/VAMOS, WCDMA/HSPA/HSPA+, LTE-FDD, LTE-TDD (incl. MIMO), CDMA2000<sup>®</sup> 1xEV-DO Rev A/B, TD-SCDMA, WLAN and Bluetooth
- I Testing of all layers from RF to protocol up to application layer
- Fully integrated IPv4/IPv6 infrastructure for end-to-end application test:
  - File transfer via FTP, Web browsing via HTTP
  - IP stream forwarding to the internet

IVoLTE - IMS Voice-/Video-Call testing the base for NG eCall service in the

- future
- ∎Video streaming
- ∎And more...

#### Benefits of using the R&S®CMW500 radio communication tester for eCall/ERA-GLONASS testing:

- Controlled network conditions e.g. country and operator configuration, power levels, speech codecs, etc.
- Reproducible test conditions and results

Automotive

Full access to test results and test conditions

# R&S eCall / ERA-GLONASS test setup PSAP emulator CMW-KA094/095

#### R&S®CMW-KA094/095

#### Key Features:

- PSAP simulation for eCall (KA094) and ERA-GLONASS (KA095) over GSM and UMTS
- PUSH mode , PULL mode without prior hang up, PULL mode with prior hang up, PULL mode without prior, PUSH mode (test if the IVS allows it)
- eCall Flag indication
- I Measure MSD transmission time
- Time since call establishment, Time since start trigger (from PSAP), Time since sync frame (FoM)
- MSD decoding
  - according to CEN EN 15722:2015 and GOST R 54620:2011 for every redundancy version and for every uplink data part
- Optional recording of un-decoded signal from IVS
- Optional audio connection to CMW-Z50 or external audio analyzer
- Details on PUSH and SYNC indications
  - Timing, Count
- Optional fixed position GPS/GLONASS simulation with SMBV
- ∎ ERA-GLONASS SMS Protocol support

#### Benefits of using the Rohde & Schwarz PSAP simulator

- Controlled environment without influence of network operator
- Reproducible test conditions and results

Automotive

• Possibility to test real ecall with emergency number 112 ← high risk in live network

# R&S eCall / ERA-GLONASS test setup R&S SMBV100A Signal Generator

COMPANY RESTRICTED

#### R&S®CMW-SMBV100A

#### Key Features:

- I Fully fledged GNSS simulator with GPS, Glonass, Galileo, BeiDou and QZSS/SBAS
- I Up to 24 satellites can be simulated
- Internal baseband generator supporting 3GPP LTE FDD and TDD, LTE-Advanced, 3GPP FDD/HSPA/HSPA+, GSM/EDGE/EDGE Evolution, TD-SCDMA, WLAN (incl. 802.11p), and all other important digital standards
- Frequency range: 9kHz to 3.2/6GHz
- Level range\_-145dBm to + 18 dBm
- I Suitable for GOST R 55534 GNSS testing

#### Benefits of using the R&S SMBV100A signal generator

- Controlled environment without external influence of live signal
- Reproducible test conditions and results

Automotive

• Fulfills the requirements for GOST R 55534 GNSS verification

06/08/2017 Automotive Technology Day 2017

13

- I Rohde & Schwarz provides the ideal solution for standard-compliant conformance testing of eCall / ERA-GLONASS modules.
  - Test if your IVS module comply with eCall / ERA-GLONASS standards
  - Verify the IVS modem is able to trigger an emergency call automatically and manually
  - Verify MSD data transmission and the voice connection with the PSAP

06/08/2017

- Compare received MSD data with expected values
- Audio Quality test of voice connection and GNSS receiver testing can be added
- Logs of ACK/NACKS/Timers allow detailed troubleshooting
- I In line with conformance test specifications for IVS testing:
  - CEN/TS 16454, GOST R 55530 and ETSI TS 103412
- CMW500 and SMBV100A are also suitable for
  - GOST R 55531 audio tests (CMW500 + Audio Analyzer)
  - GOST R 55534 GNSS tests (SMBV100A)
- The introduced R&S instruments are a save investment also to meet upcoming automotive test requirements e.g. NGeCall (based on LTE and IMS).
- New EU regulation for eCall testing 2017-79 EU

Update confguration			

The IVS supports two modulation modes, a fast modulation mode and a robust modulation mode.

- Under normal conditions, an MSD transmission is expected to succeed in fast modulation mode.
- The robust modulation mode serves as a fallback solution if a transmission fails in unusually difficult environments.

Force robust mode					
Update confgur	ation				

The IVS supports two modulation modes, a fast modulation mode and a robust modulation mode.

- Under normal conditions, an MSD transmission is expected to succeed in fast modulation mode.
- The robust modulation mode serves as a fallback solution if a transmission fails in unusually difficult environments.
- The modulation modes merely differ by symbol duration, i.e., the length of the modulation frames, which is 2 ms for the fast modulation mode and 4 ms for the COMPANY RESTRICTED

# **MSD** transmission

UL transmission frame and DL feedback

- **I** UL: Minimum Set of Data (MSD):
  - The IVS transmitter modulates the MSD data to generate signals suitable for transmission over the in-band voice channel to the PSAP
  - The MSD is represented by a field of 140 bytes, protected by a 28 bit CRC code (prior to HARQ FEC encoding).
  - 1 MSD contains 3 data parts and 4 muting periods in-between + preceeding synchronization frame
  - requirement: < 4 seconds MSD transmission time
- DL message contains NACK if CRC failed etc. (check length of signal)

NACK = Non-Acknowledgement, CRC = Cyclic redundancy check, DL = downlink, UL = uplink

### **MSD** transmission

### **MSD** transmission

Picture 1: Time since Call Established

Picture 2: Time since START

Picture 3: Time since SF

### MSD transfer sequence (HLAP flow diagram)

#### eCall signaling procedure:

DE&SCHWARZ

Automotive

Initiation: In the event of an accident, IVS establishes an automatic 112 voice call => continuous start messages are sent (max. 5x)

Send-MSD: PSAP receives emergency call and triggers MSD transmission (PULL mode mandatory), continuously sends start until it detects the first incoming sync frame

MSD-tx: IVS sends sync frame (dotted) after 3 successfully decoded START messages, MSD RV0 in 3 blocks (fast mode), then MSD RV1 (since IVS receives first NACK, but discontinued after receiving LL-ACK)

NACK: PSAP detects uplink sync and continuously transmits NACK

LL-ACK: PSAP tries to decode MSD after complete reception of RV0, and after each data part of subsequent RVs

AL-ACK: Upon CRC success, PSAP sends 3 ACK messages and then stops transmission => voice channel is un-muted

Play tone: To test the voice channel in the R&S PSAP implementation a 1kHz sine tone is played
