- More than minimum Performance
- Wireless Coexistence: Adaptivity
- Further Discussion, Backup

Who cares?

The individual regulator per EU / EFTA / Candidate / MRA country can decide market surveillance measures.

The combined group of regulators → e.g. TCAM can run administrative cooperation campaigns.

Market Surveillance Example

German regulator - online trade interventions per product category

Source: BundesNetzAgentur.
Statistik Marktüberwachung 2017

Rank	Category	Stops of Online Sales
1	Radio headphones	338,272
2	Drones / Quadrocopters	64,134
3	Smartwatches	19,884
4	Radio transmitters (e.g. portable FM Tx')	17,194
5	Backup cameras	3,085
6	Remote-controlled sockets	2,210
7	Audio mixers	2,029
8	Hand-held radios	1,751
9	LED lamps	1,181
10	e-cigarettes	1,173
11	Surveillance cameras	1,063
12	Radio door bells	971

Be aware of Market Surveillance by TCAM / ADCO

Telecommunication Conformity Assessment and Market Surveillance

TCAM

Regulators of...
EU states +
EFTA states +
„candidates“ + ?UK?

Each regulator can decide on random checks up to 10 years after market placement and may ask for

- Test reports
- Declaration of Conformity
- Purchase of radio equipment
- Test of radio equipment
- Notes and calculations done during the risk assessment

Is there a mismatch?

Is there something strange?

Joint Actions

Committee work,
around 3 meetings
per year.

Common Data
including black-list

Administrative Cooperation - RED

- Trials
- Cross-border surveillance Campaigns
- Conformity assessment cooperation

Extra:

Administrative
Cooperation - EMC

No Harmonisation on Sanctions among the States.

- Germany: Funkanlagenengesetz („Law of Radio Equipment“)
 - Formal error → 10 kEUR
 - Test chapters omitted on purpose → 100 kEUR
 - Valid standard version omitted → 100 kEUR
- Switzerland
 - In case of imports: private persons can be sewed
 - 1st time: 3000 CHF fine
 - Follow up in the media
 - Fulfillment centers are not responsible

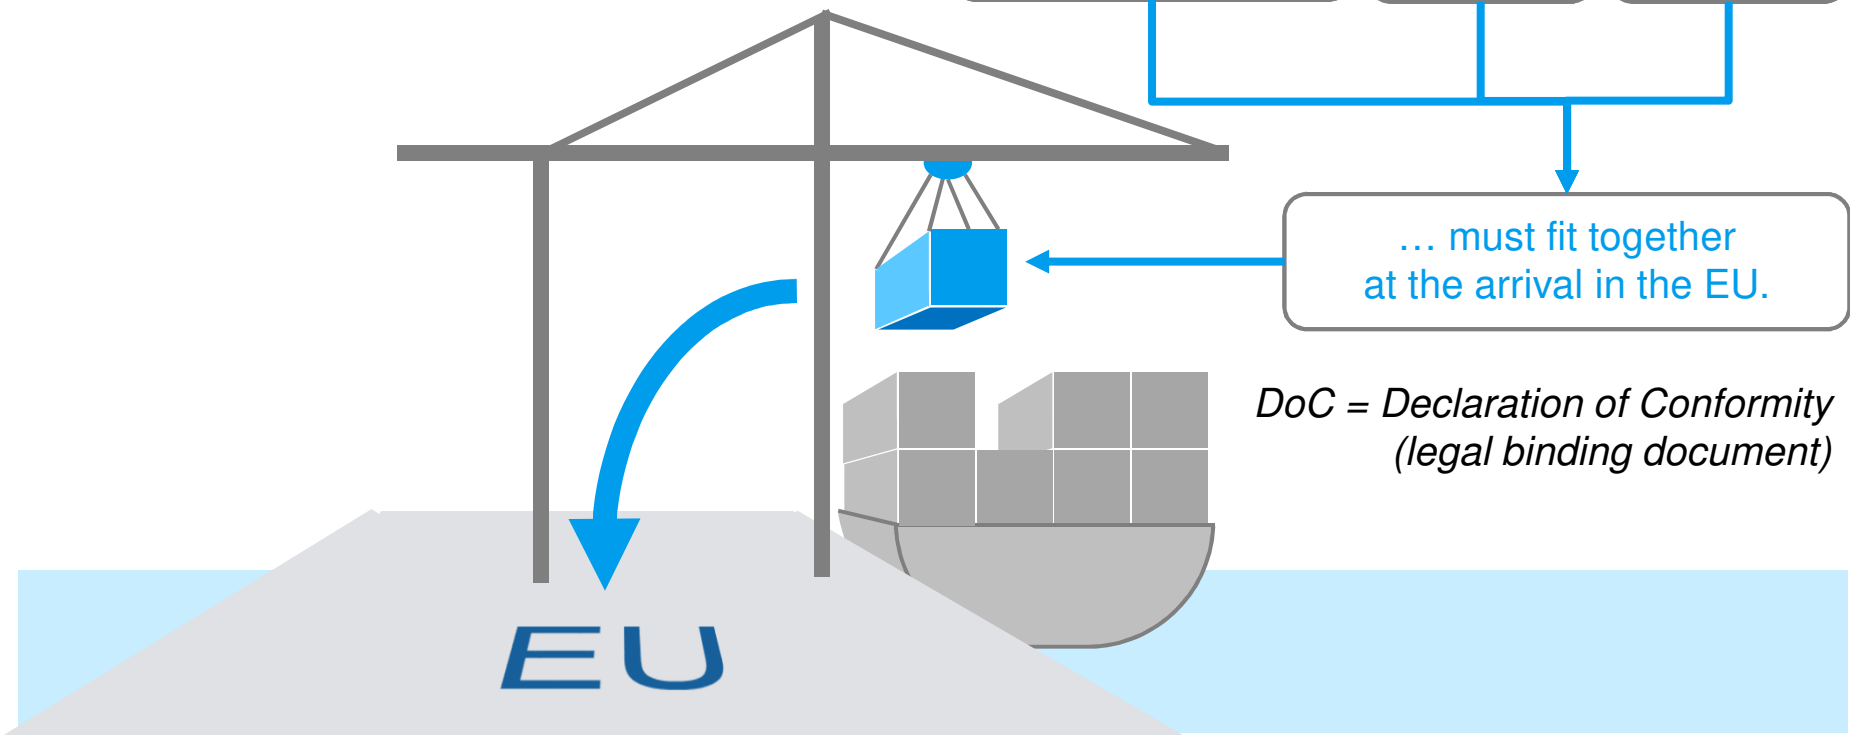

Market Placement

Market Placement ≠ Market Launch

- Up-to-date EN Standard version
- DoC per item
- Date dd-mm-yy

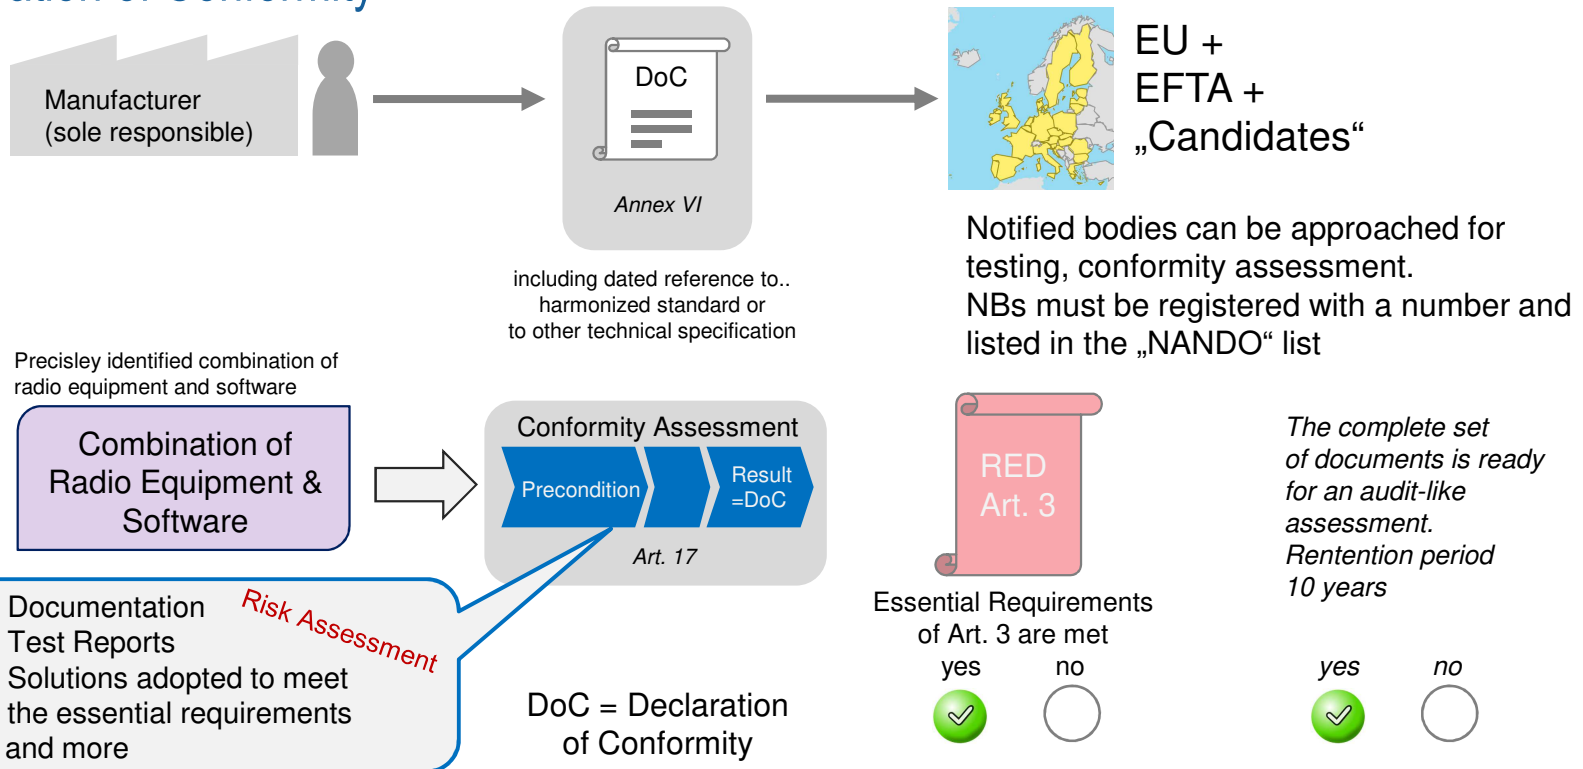

... must fit together at the arrival in the EU.

DoC = Declaration of Conformity (legal binding document)

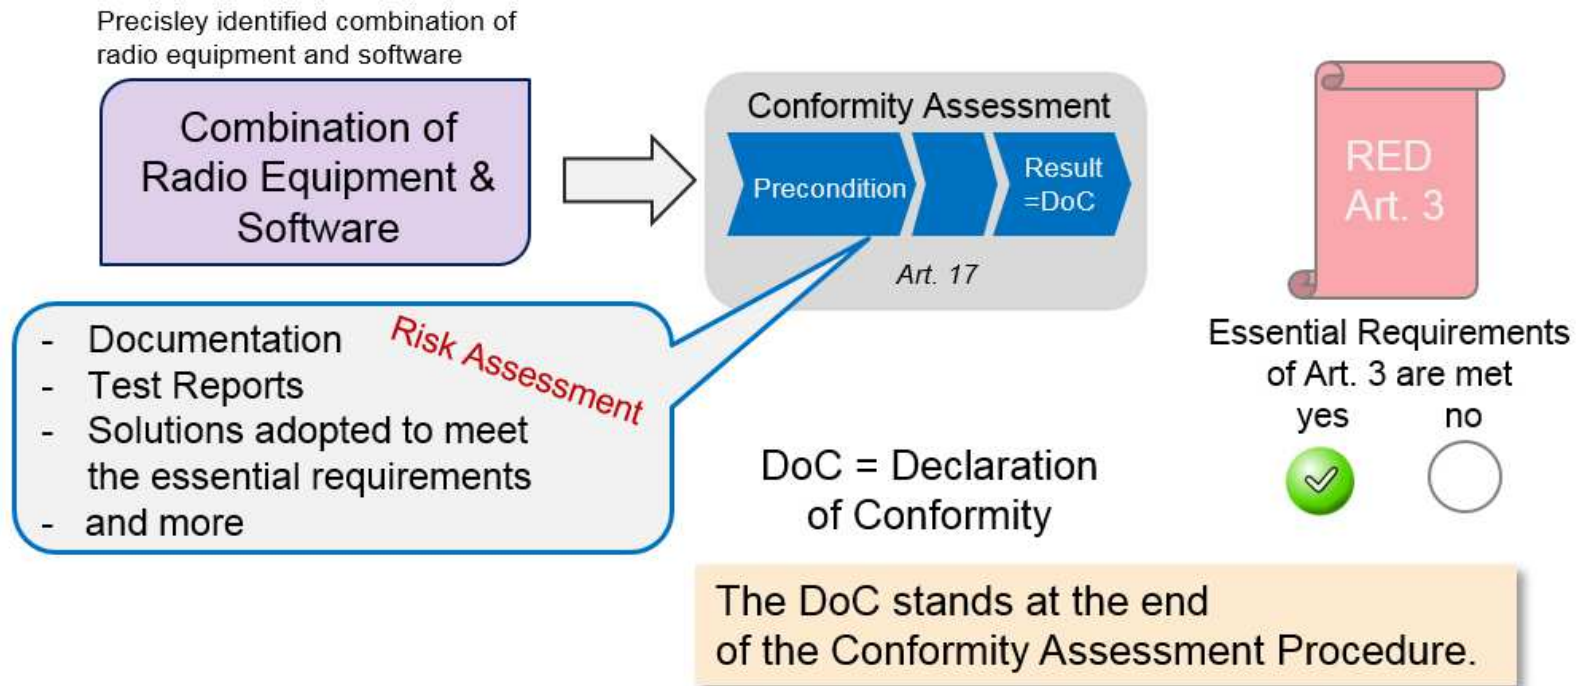

Manufacturer's Homework according RED

Declaration of Conformity

Declaration of Conformity

The Declaration of Conformity marks the end of a process

On the radio part...

self-declaration is possible as soon as a harmonised standard is published in the Official Journal of the EU.

Refresher Topics on Radio Equipment Directive

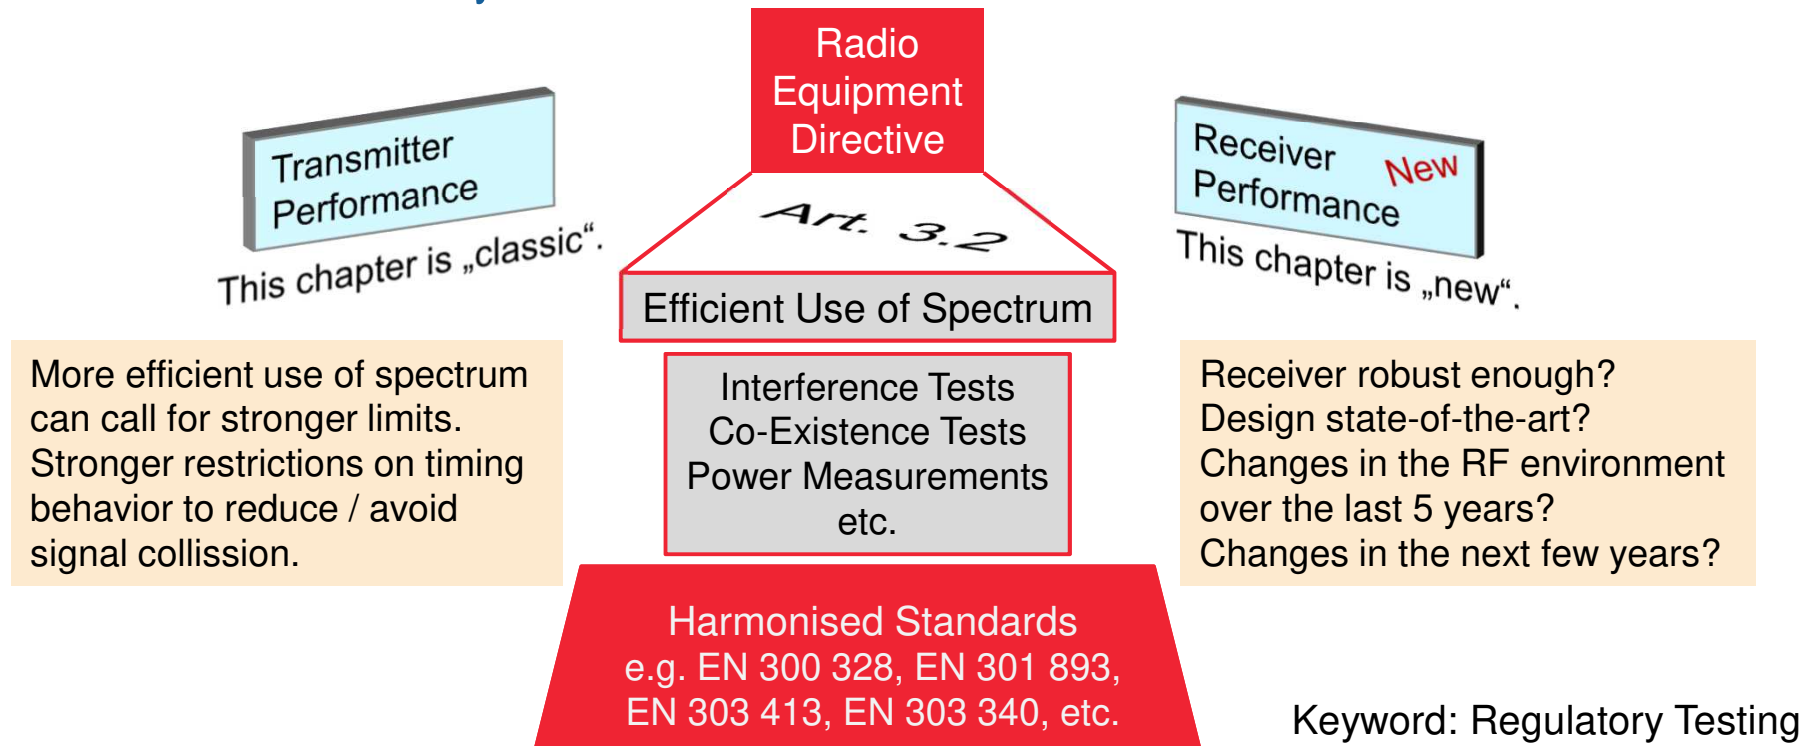

Agenda

- Who cares? Administrative Part
- Increase of Testing Efforts
- Self-Declaration, how to find a published Harmonised Standard
- Wireless Coexistence Basics: Receiver Robustness
- More than minimum Performance
- Wireless Coexistence: Adaptivity
- Further Discussion, Backup

RED: Radio Equipment Directive

2014/53/EU: mandatory since June 2017

Increase of Testing Efforts

Check the standard versions:
The table of contents is a good
indicator for testing efforts.

Harmonised
Standard under the
R&TTE Directive

Table of
Contents

Harmonised
Standard under the
Radio Equipment
Directive (RED)

Table of
Contents

Increase of Testing Efforts

Example: EN 302 567 under Directive 1999/5/EC (R&TTE)

Example:
„WIGIG“ Standard
under R&TTE

5	Testing for compliance with technical requirements.....	11
5.1	Environmental conditions for testing	11
5.2	Interpretation of the measurement results	11
5.3	Essential radio test suites.....	12
5.3.1	Product Information.....	12
5.3.2	Test modulation, frequency and configuration	12
5.3.3	Spectral power density.....	13
5.3.4	RF output power	14
5.3.5	Transmitter unwanted emissions.....	15
5.3.5.1	Pre-scan.....	15
5.3.5.2	Identified emissions	16
5.3.6	Receiver unwanted emissions.....	16
5.3.6.1	Pre-scan.....	17
5.3.6.2	Identified emissions	17
Annex A (normative):	HS Requirements and conformance Test specifications Table (HS-RTT).....	18

Chapter 5 of a harmonised EN standard under RED (article 3.2) describes the test procedures. The chapter 5 can be taken as a measure of testing efforts. Take a look at the chapter 5 when changing from R&TTE (old regulatory regime) to RED (new regulatory regime). You can do this kind of effort comparison with any harmonized EN standard that existed under R&TTE.

Increase of Testing Efforts

Example: EN 302 567 under Directive 1999/5/EC (R&TTE)

Example:
„WIGIG“ Standard
under R&TTE

5	Testing for compliance with technical requirements.....	11
5.1	Environmental conditions for testing	11
5.2	Interpretation of the measurement results	11
5.3	Essential radio test suites.....	12
5.3.1	Product Information.....	12
5.3.2	Test modulation, frequency and configuration	12
5.3.3	Spectral power density.....	13
5.3.4	RF output power	14
5.3.5	Transmitter unwanted emissions.....	15
5.3.5.1	Pre-scan.....	15
5.3.5.2	Identified emissions	16
5.3.6	Receiver unwanted emissions.....	16
5.3.6.1	Pre-scan.....	17
5.3.6.2	Identified emissions	17
Annex A (normative):	HS Requirements and conformance Test specifications Table (HS-RTT).....	18

Increase of Testing Efforts

Example: EN 302 567 under Directive 2014/53/EU (RED)

Example:
„WIGIG“ Standard
under RE-Directive

Extended table
of contents in the
standard

5	Testing for compliance with technical requirements.....	16
5.1	Environmental conditions for testing	16
5.1.1	Introduction.....	16
5.1.2	Normal test conditions	16
5.1.2.1	Normal temperature and humidity	16
5.1.2.2	Normal power source	17
5.2	Interpretation of the measurement results	17
5.3	Test procedure for the essential radio test suites	17
5.3.0	General.....	17
5.3.1	Product Information.....	17
5.3.2	Test modulation, frequency and configuration	18
5.3.3	Spectral power density.....	18

Is Self-Declaration possible?

Article 3 of the RED has an „umbrella“ function.

YES for 3.1b, if...

... the radio equipment complies to an applicable harmonized EMC standard with reference to art. 3.1 of directive 2014/53/EU then the radio equipment is presumed to be in conformity with the essential requirements set out in article 3.1 b of the RED.

For the EMC part, self-declaration is always possible.

YES for 3.2, if...

... the radio equipment complies to an applicable harmonized standard with reference to art. 3.2 of directive 2014/53/EU then the radio equipment is presumed to be in conformity with the essential requirements set out in article 3.2 of the RED.

For the Radio part, self-declaration is possible, if the applicable EN standard is listed in the Official Journal (EU). Outsourcing of tests possible.

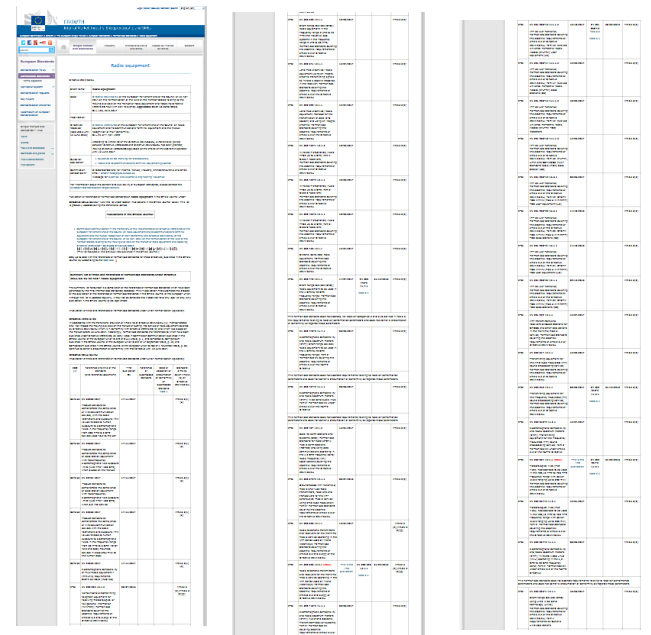

How to check the status „published“ of a standard?

http://ec.europa.eu/growth/single-market/european-standards/harmonised-standards/red_en

A long list....

Manufacturer

EU DECLARATION of CONFORMITY (DoC)
(No. 11())

This declaration of conformity is issued under the sole responsibility of the manufacturer:

Name: [Redacted]
Address: [Redacted]

We declare that the DoC is issued under our sole responsibility and belongs to the following product.

Object of the declaration:

Product Name	Car audio with DAB radio,	
Model Name	[Redacted]	
Software Ver.	[Redacted]	
Accessories	N/A	

The object of the declaration described above is in conformity with the relevant Union harmonization legislation:
Radio Equipment (RE) Directive (2014/53/EU)

The following harmonized standards and technical specifications have been applied:

Health & Safety (Article 3.1(a)):	EN 60065:2014
EMC (Article 3.1(b)):	EN 301 489-1 V2.1.1 EN 301 489-3 V2.1.0 (Draft)
Radio Spectrum (Article 3.2):	EN 303 345 V1.1.1 (Draft)

Notified Body performed an EU-type examination in accordance with the requirements of Annex III of RE Directive and issued the EU-type examination certificate.

Notified Body:
UL Japan, Inc. (No. 1731)
4383-326 Asama-cho, Ise-shi, Mie-ken 516-0021, Japan

Certificate No.: ULA# [Redacted]

Signed for and on behalf of:

[Redacted]	[Redacted]	[Redacted]
Place of Issue:	Date of Issue:	General Manager Engineering Div.

Refresher Topics on Radio Equipment Directive

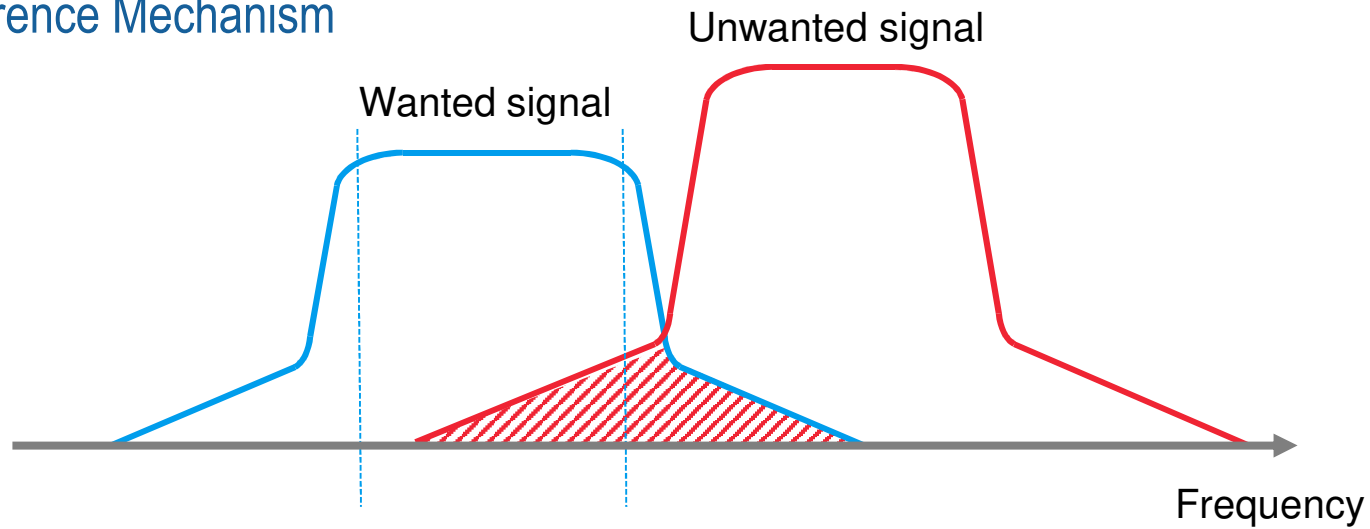

Agenda

- Who cares? Administrative Part
- Increase of Testing Efforts
- Self-Declaration,
how to find a published Harmonised Standard
- **Wireless Coexistence Basics: Receiver Robustness**
- More than minimum Performance
- Wireless Coexistence: Adaptivity
- Further Discussion, Backup

Wireless Coexistence

Interference Mechanism

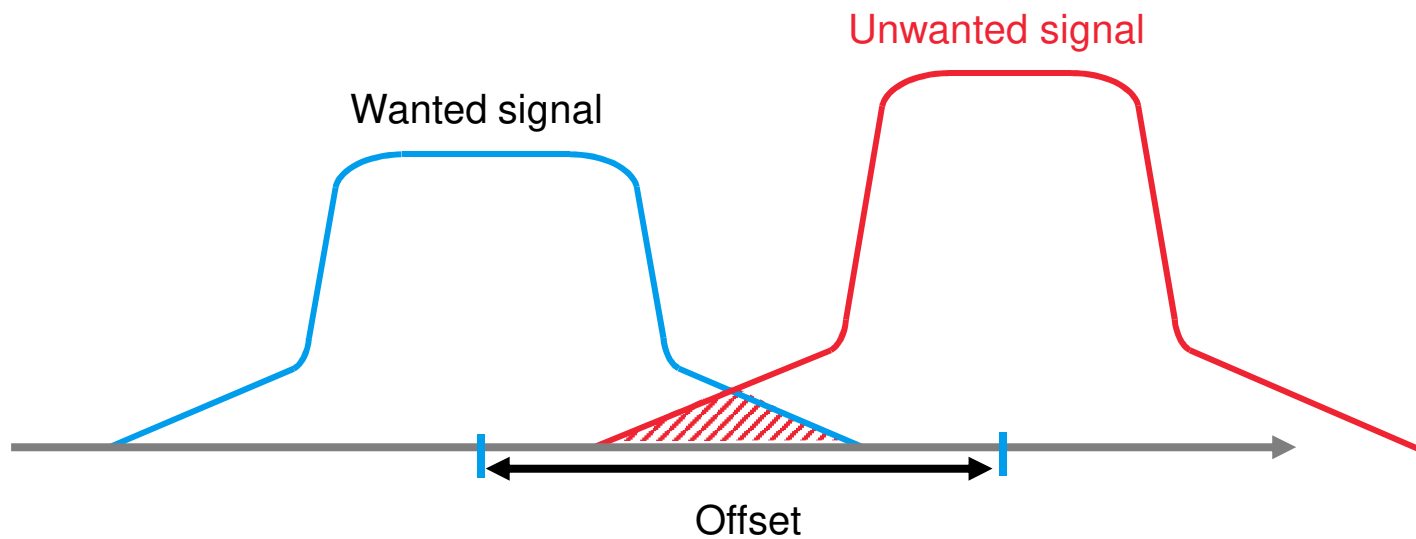

Pattern area: overlap translates into an increased noise level on the wanted receiver side.

Unwanted signal adjacent to wanted signal

Wireless Coexistence

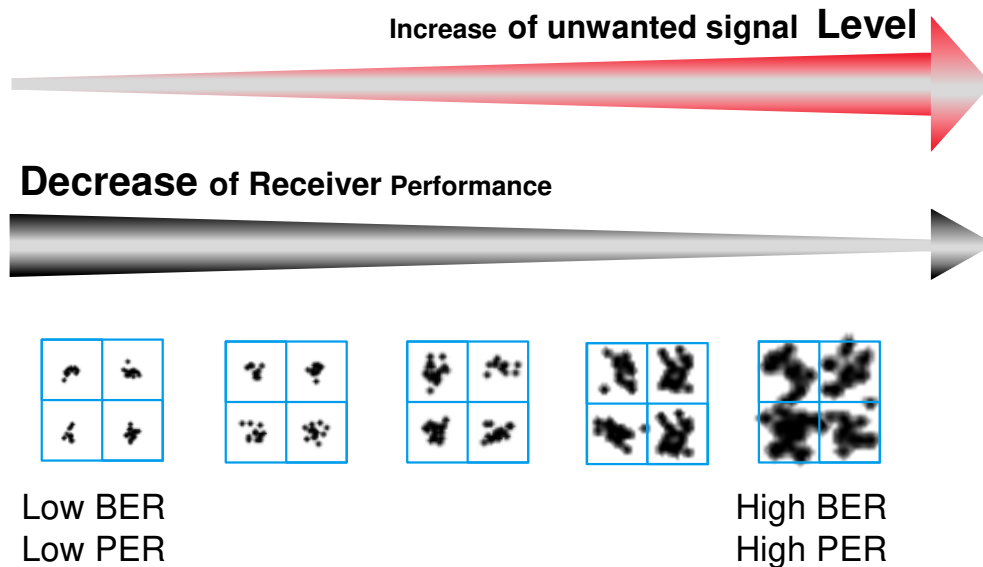

Interference Mechanism

Pattern area: overlap translates into an increased noise level on the wanted receiver side.
Unwanted signal with offset to wanted signal

Receiver under Interference Condition

Wanted signal receiver
= receiver under interference conditions:

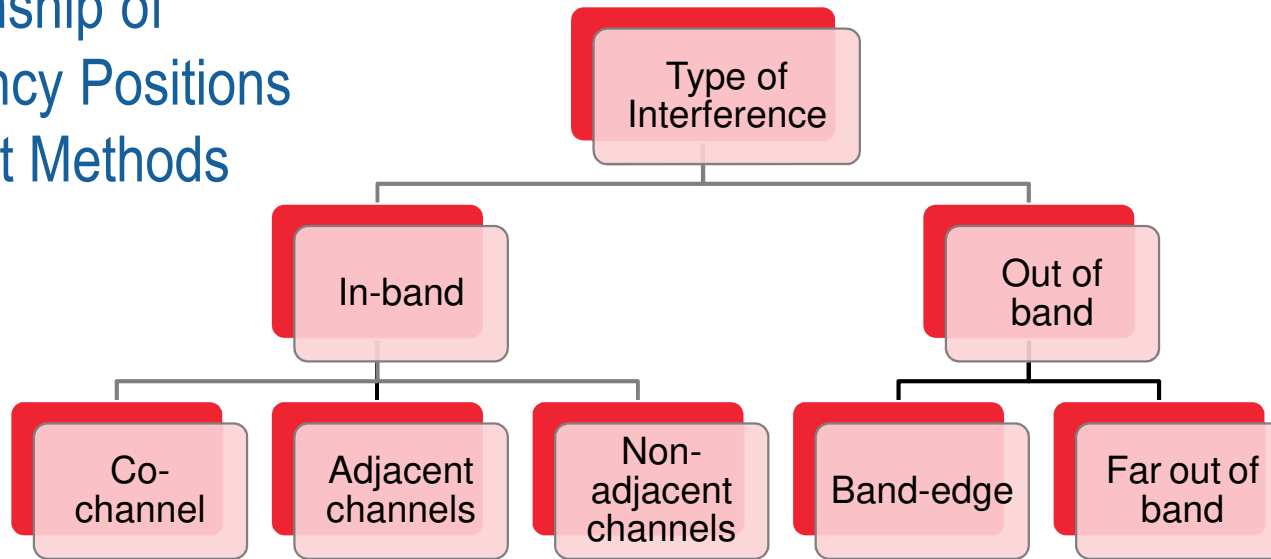

Can the receiver handle the interference
and provide with a good performance?

Does the receiver ask for retransmission
again and again while the already transmitted
data is wasted (pure design)?

Does the receiver support for example
a HARQ process and therefore asks
for re-transmissions only when necessary
(advanced design)?

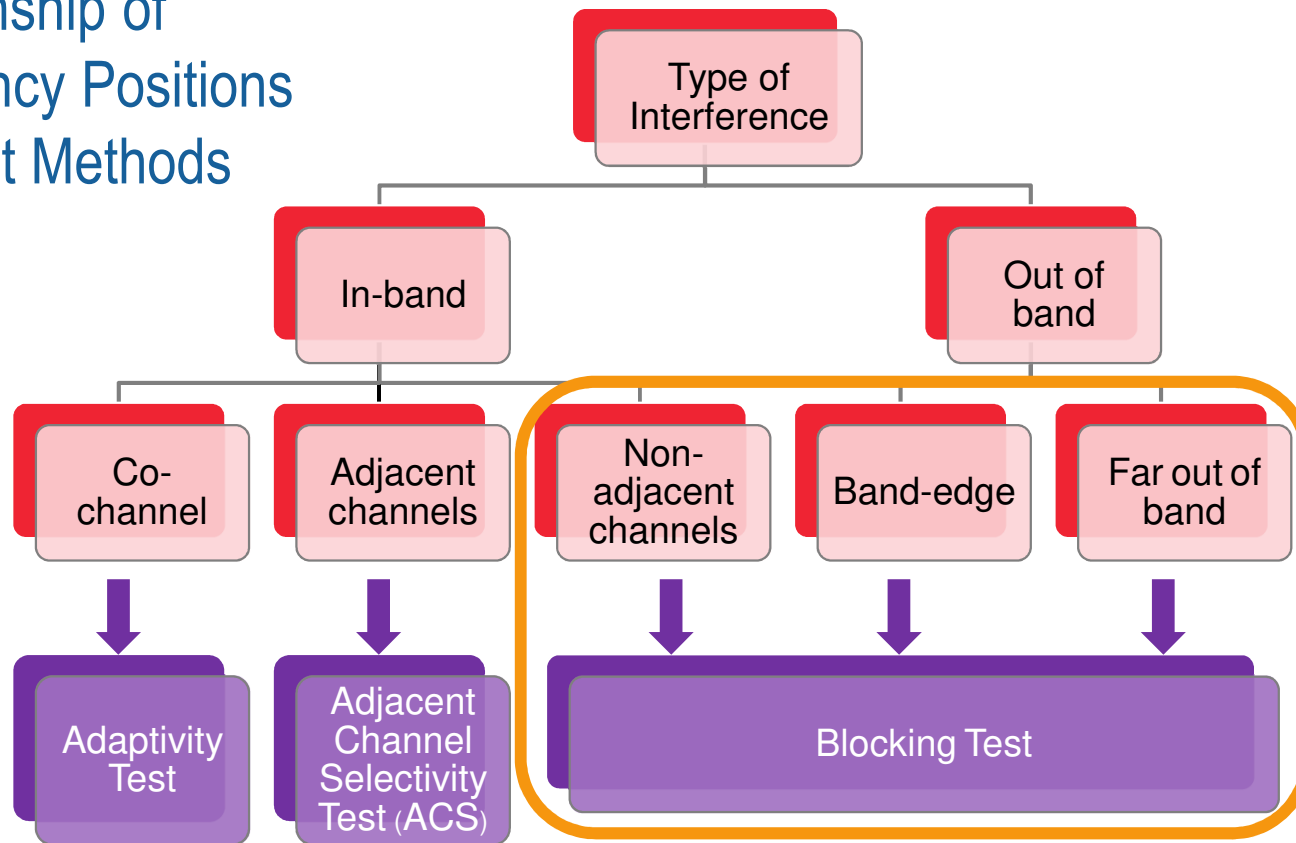

Relationship of Frequency Positions and Test Methods

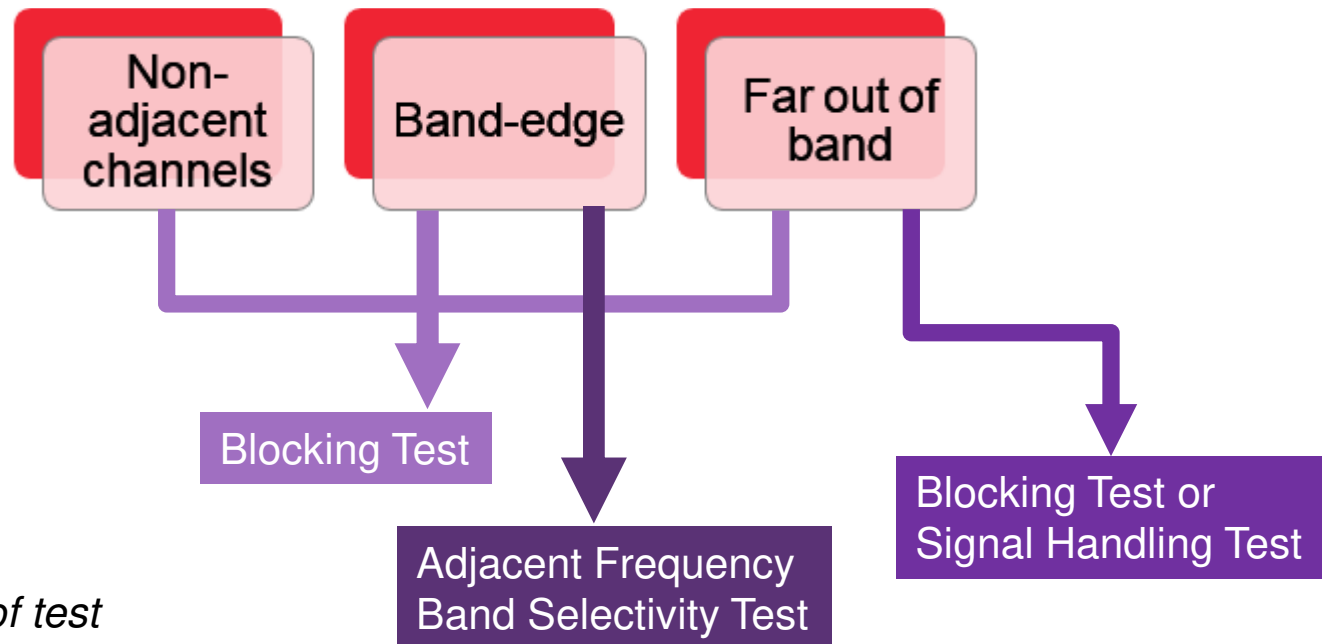

Picture based on an idea from IEEE Std. 1900.2

Relationship of Frequency Positions and Test Methods

Picture based on an idea from IEEE Std. 1900.2

Relationship of Frequency Positions and Test Methods

Different names for the same principle of test

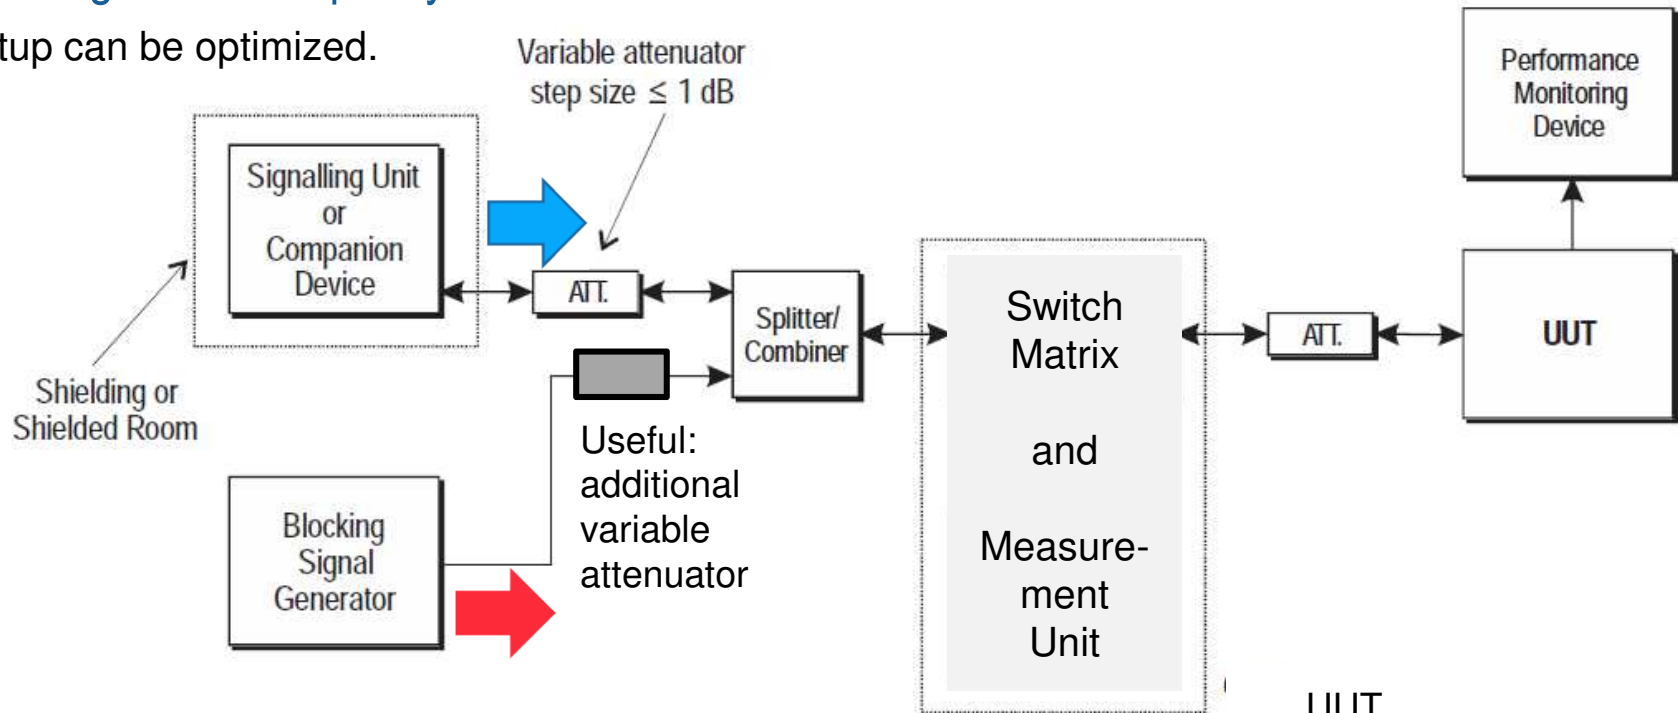

Receiver under Interference Condition

Receiver under Interference Condition

Blocking Test Example by ETSI BRAN

Setup can be optimized.

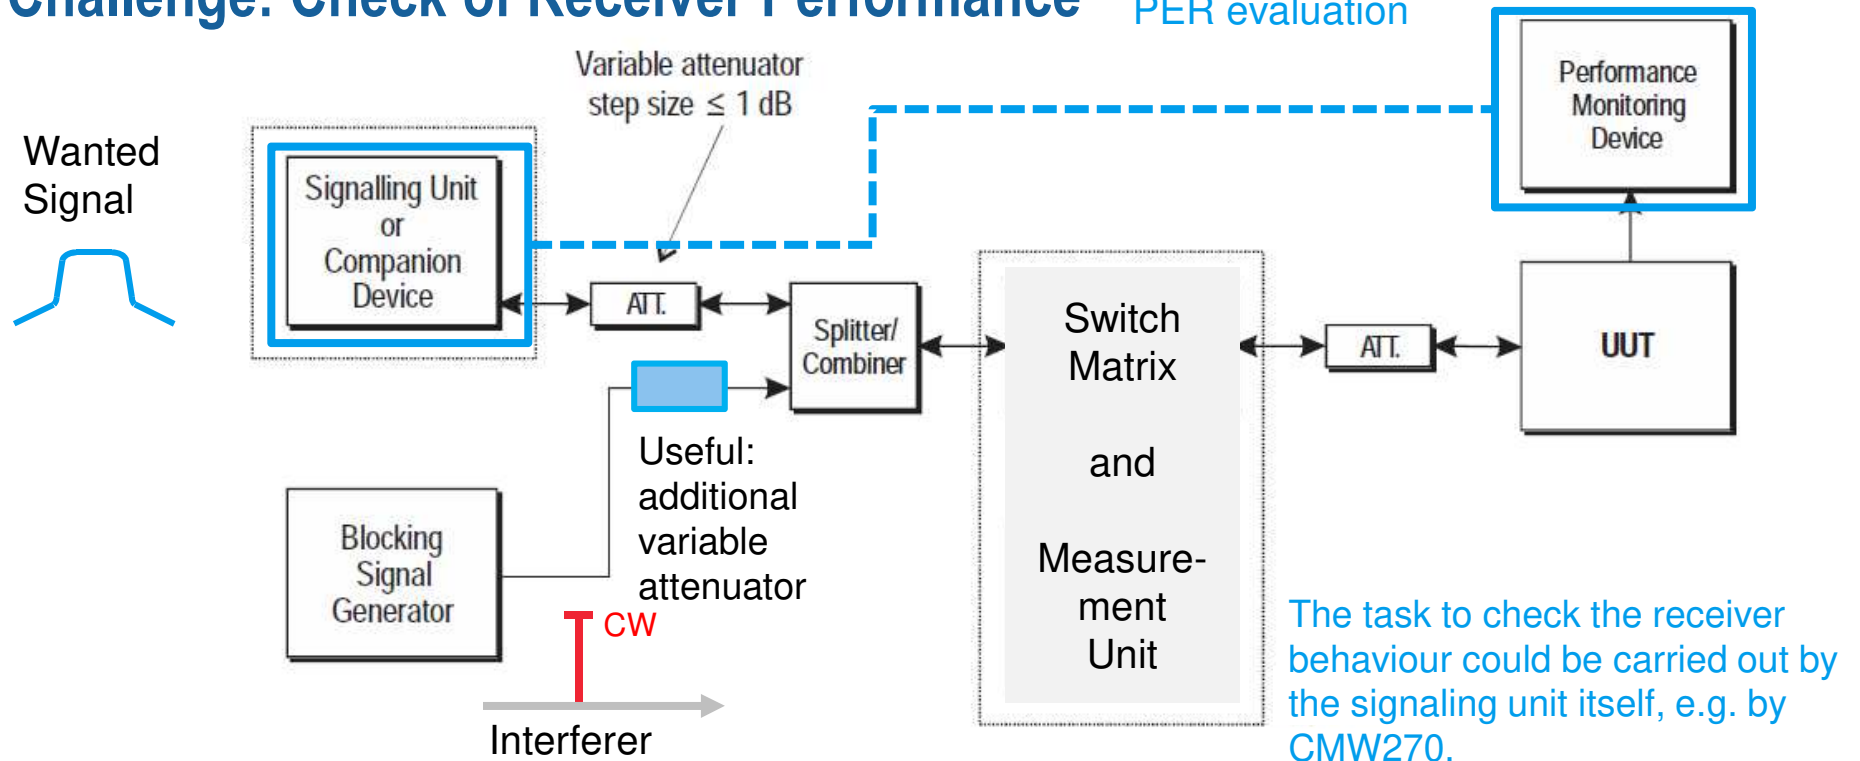

Picture from ETSI TS 103 521 v 1.1.1 with modification

UUT
User Equipment Under Test

Blocking Test in EN 301 893: Challenge: Check of Receiver Performance

Tasks handled by signaling unit
e.g. by CMW270 during blocking test
PER evaluation

The task to check the receiver behaviour could be carried out by the signaling unit itself, e.g. by CMW270.

RED Approach allows Wireless Coexistence Tests

Radiated Test

Radiated testing is required if the antenna is built-in and if the antenna port can not be reached.
Suggestion:
immunity test system

Unwanted signal

Waveform,
LTE uplink (FDD7 Europe)
LTE TDD 41 (USA)

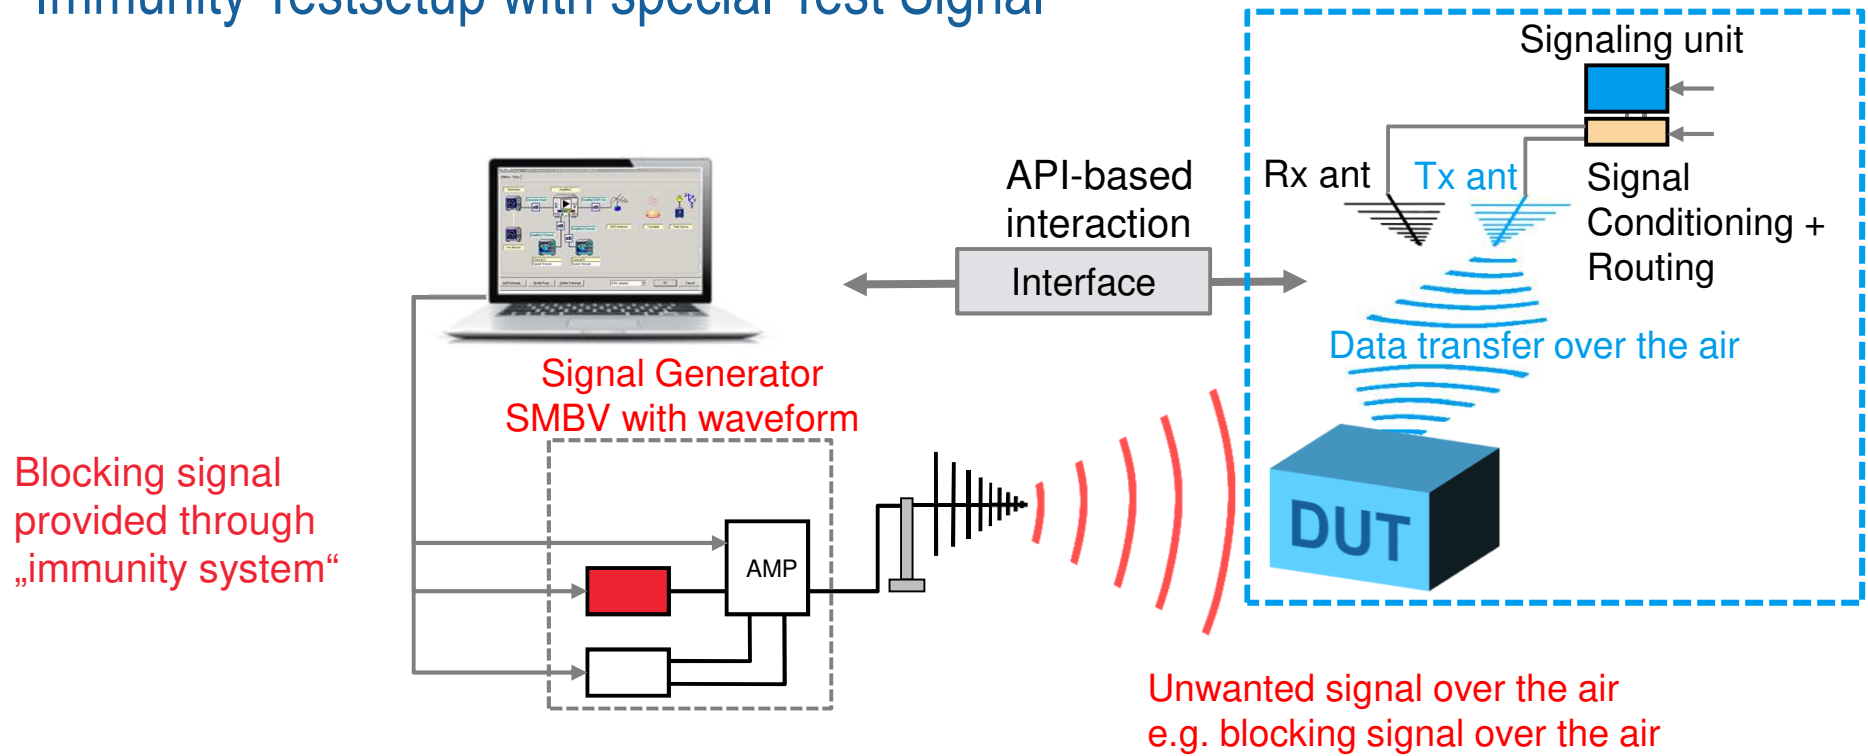

e.g. non-cellular link maintained by CMW.
Parameter to monitor:
PER, BER or NACK

Throughput reported by the DUT can be used for the characterization of the communication quality.

Immunity Testsetup with special Test Signal

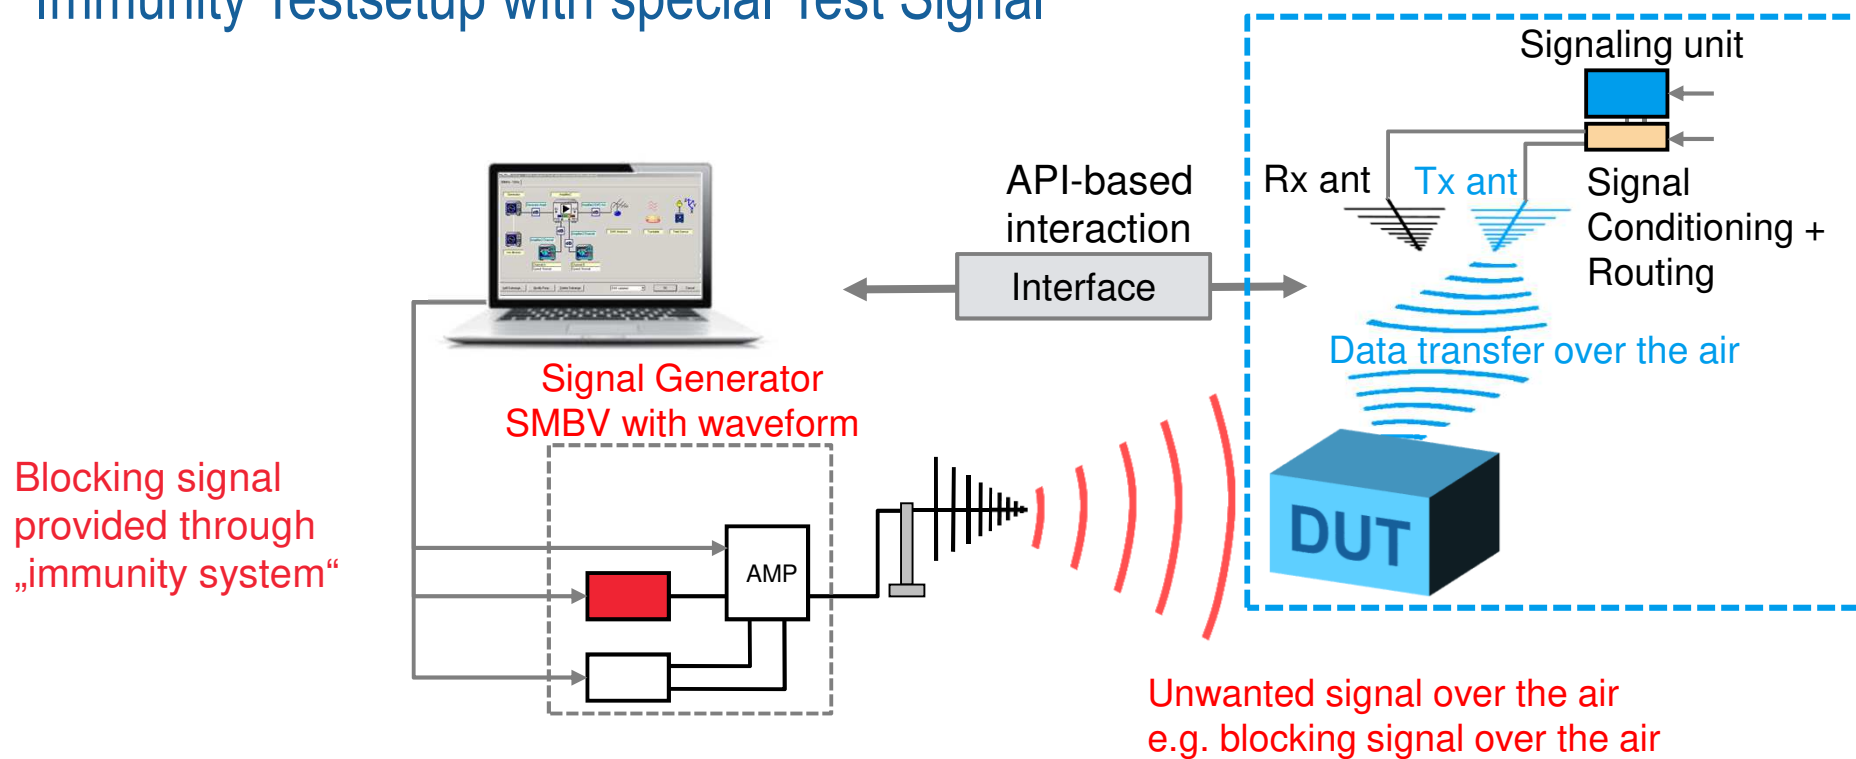

Immunity Testsetup with special Test Signal

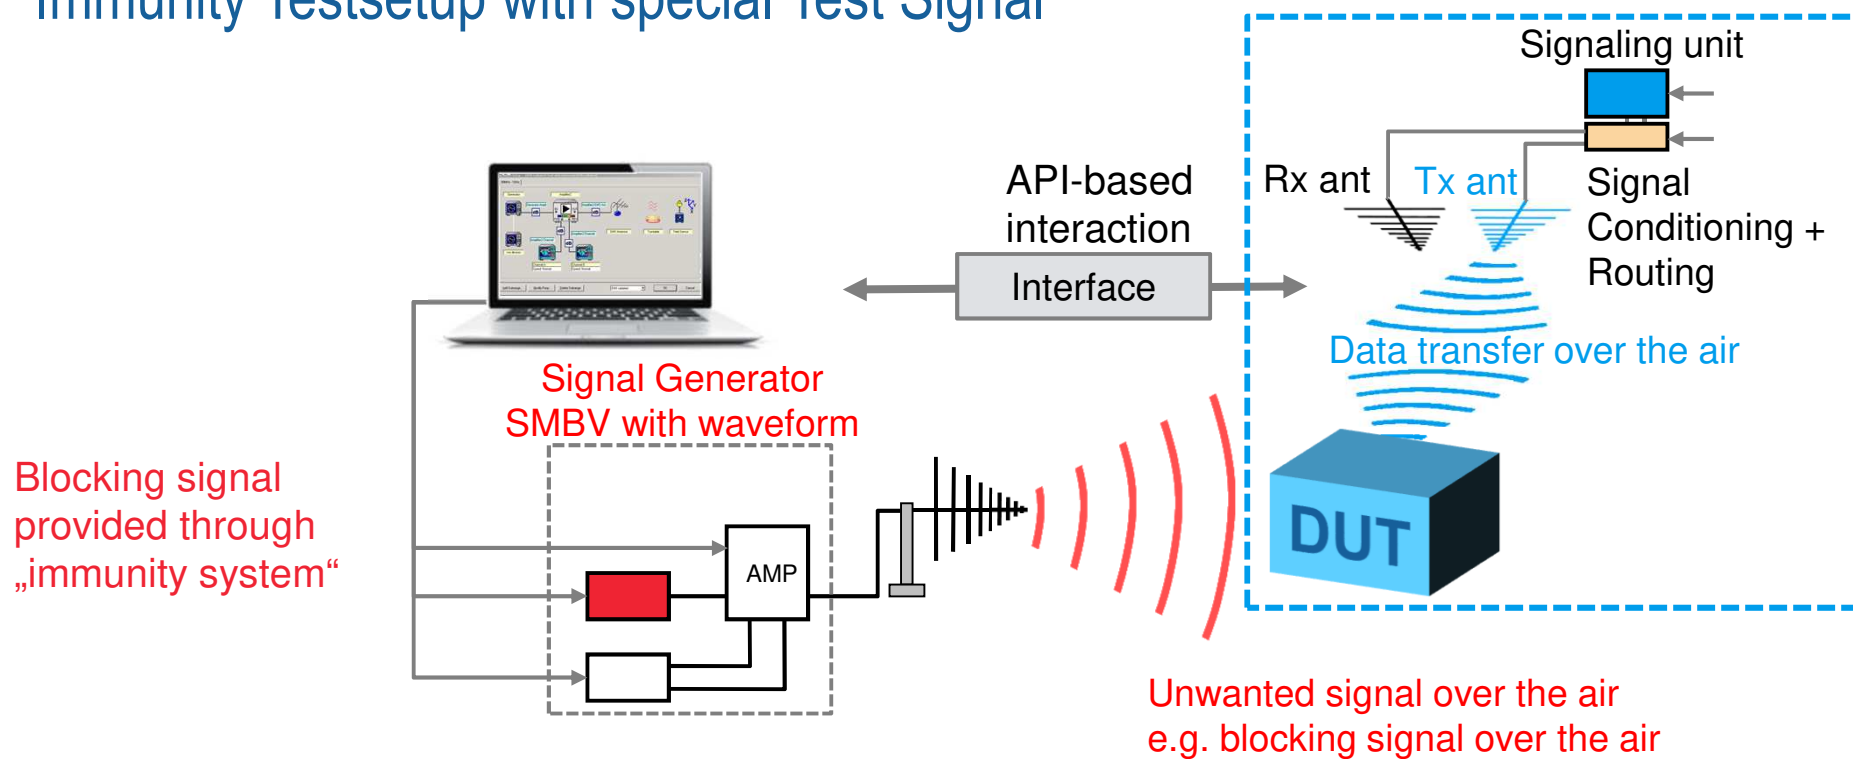

Do you remember Audio-Break-Through Tests? Do you see the similarity?

Immunity Testsetup with special Test Signal

OTA specialists may recognize a sensitivity test setup for TIS in the right block.

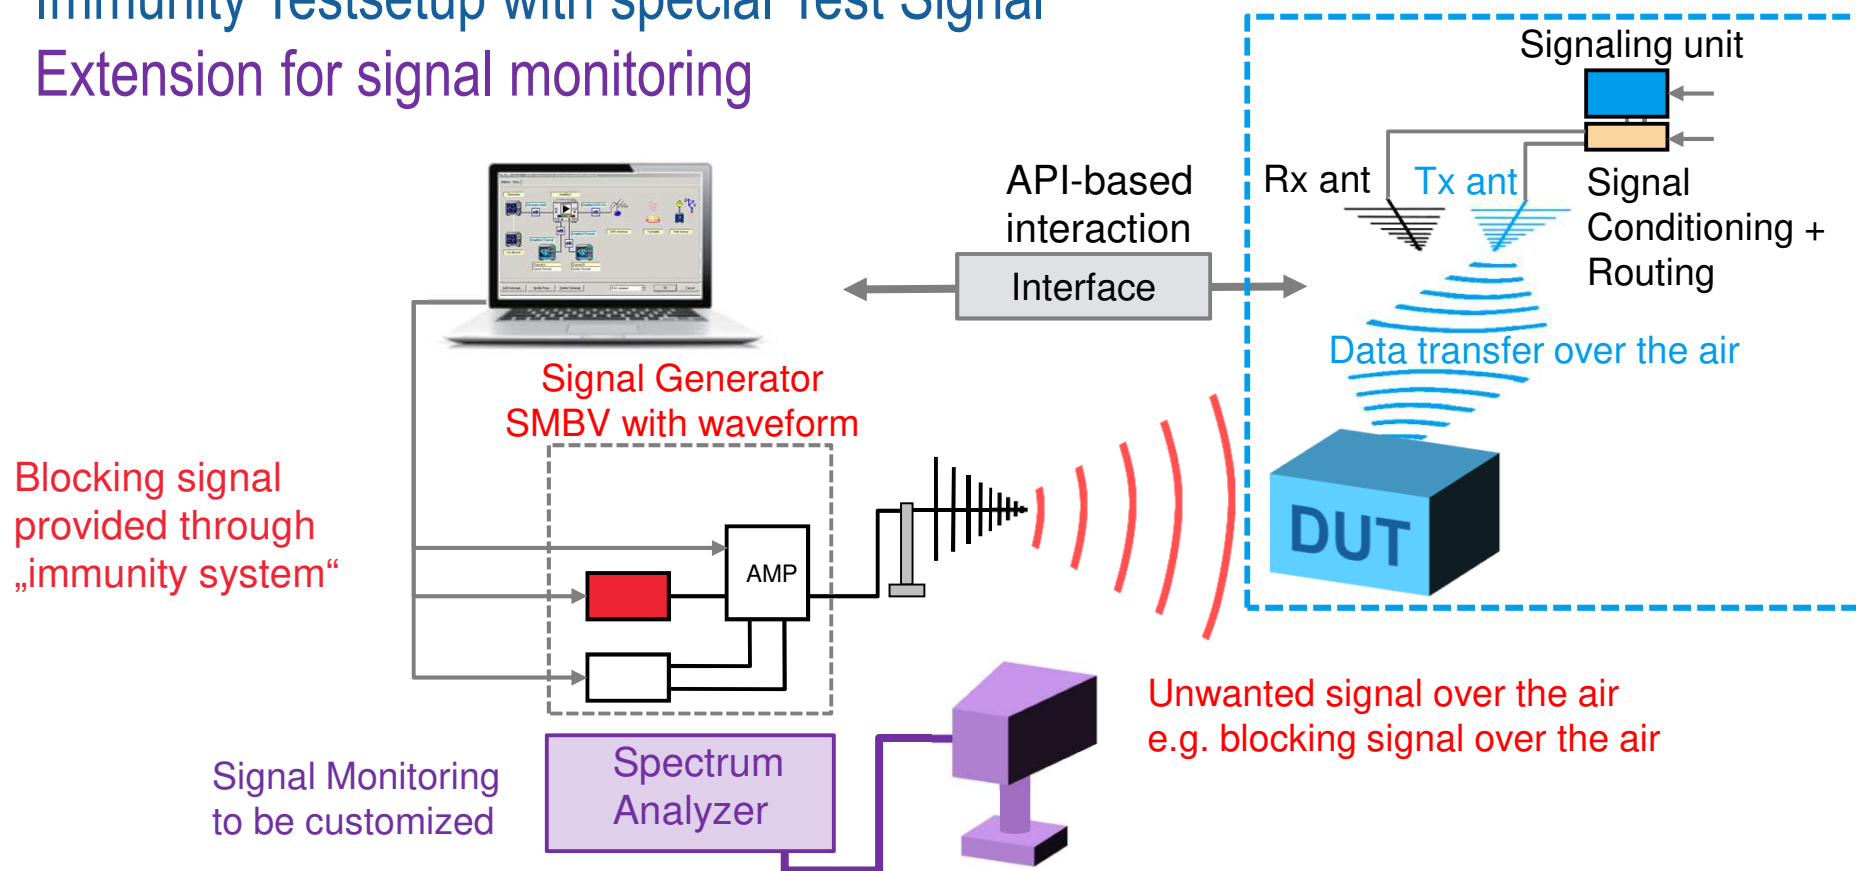

Immunity Testsetup with special Test Signal

Immunity specialists regard the right block as a sub-system for EUT Monitoring.

Immunity Testsetup with special Test Signal Extension for signal monitoring

Field Strength and Power Discussion

Scenario

Separation distance.
Interferer signal EIRP at origin.
Expected fieldstrength of the „unwanted signal“ at the UUT (victim).

➔ Simulation by immunity system
Expected field strength at UUT.
Distance between UUT and antenna for the transmission of the unwanted signal. Antenna gain.

➔ RMS power level
Calculation of the transmit power level of the unwanted signal at the antenna input.

Additional Factors

- number of subcarriers
- Bandwidth correction e.g. in case of transient interferers.

Crest Factor, PAPR
Typical for LTE: 8 dB

Be careful:

Most tools allow the evaluation of power and fieldstrength conditions for „RMS“.

For active RF signal paths you need to consider the Peak-to-Average Power Ratio PAPR (→Crest Factor).

Typical PAPR values can be derived from technical studies.

A PAPR of 8 dB is often used for LTE signal types.

More details follow later.

from 2010

Coexistence Case #3: LightSquared Case

LTE at 1552.5 MHz vs. GPS at 1575.42 MHz

Original Roll-out Plan:
Phase 0 → Phase 1 → Phase 2

Coexistence Case #3: LightSquared Case

LTE at 1552.5 MHz vs. GPS at 1575.42 MHz

Original Roll-out Plan:
Phase 0 → Phase 1 → Phase 2

Phase 0

The distance of 19 MHz was not enough.

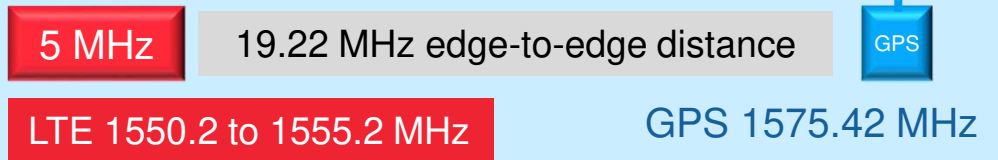

Coexistence Case #3: LightSquared Case

LTE at 1552.5 MHz vs. GPS at 1575.42 MHz

Original Roll-out Plan:
Phase 0 → Phase 1 → Phase 2

Phase 0

The distance of 19 MHz was not enough.

The license for the LTE downlink in the assigned frequency range had been officially granted. Already Phase 0 caused problems in various GPS applications, including MIL applications. After the indication of problems NPEF investigated all 3 phases in lab environment. Conclusion: the LTE base stations in the frequency range 1550.2 to 1555.2 MHz had to be switched off.

Based on this background, the GPS innovation alliance pushed the criterion „C/N0 degradation ≤ 1 dB in the presence of a defined AWGN interferer“ as neutral criterion in the ETSI standardization for GNSS, without disclosing further receiver performance details on e.g. military applications. The inputs have been regarded in EN 303 413 .

Coexistence Case #4:

Co-Location under FCC → recommended Practice for Risk Assessments

- The co-location test requirement addresses the simultaneous operation of two or more transmitters in one device.
The simultaneous operation of the intentional transmitters can cause intermodulation.
- The negative effect of intermodulation are additional spurious emissions.
- The co-location test procedure is required to show evidence, that the additional spurious caused by intermodulation are also within the spurious emission limits.
The co-location test is required, independent from the signal technology
- Procedure (example for 2 transmitters A +B):
 - 1) spurious emission test of TX A only →keep the limit
 - 2) spurious emission test of TX B only → keep the limit
 - 3) spurious emission test of the combination TX A + TX B → keep the limit
additional spurious may occur due intermodulation effect (non-linear operation of amplifiers)

“Blocking Test” by different Standards

The different standards do not follow a common base line.

From
very simple settings with fixed blocking level and CW signal

via CW signal with level adjustment

to
the full set of scenarios with variation of signal type and with
level adjustment.

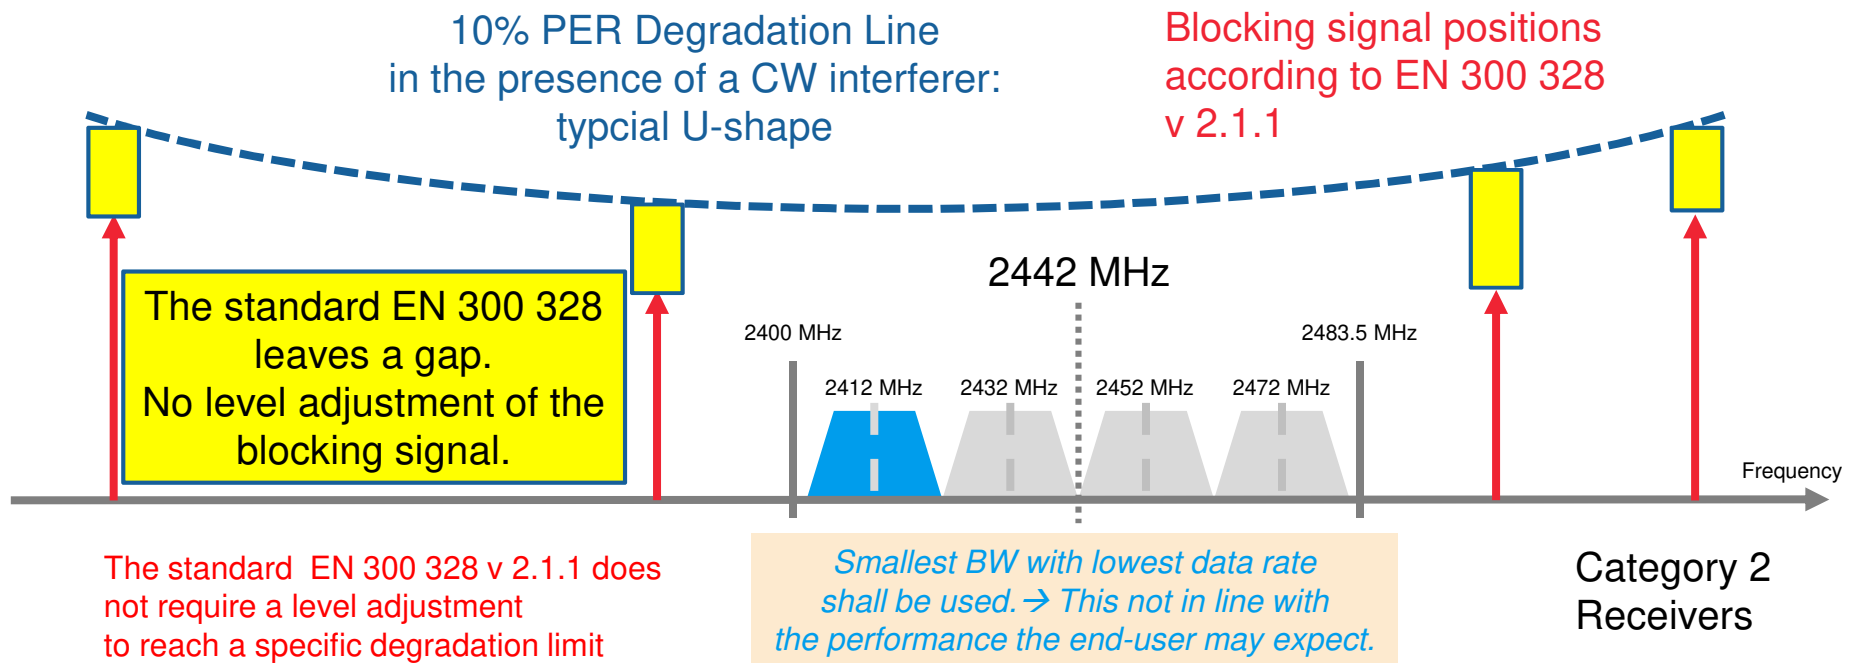

Evaluation of Rx Performance Degradation

Fixed blocking signal Levels for in 2.4 GHz ISM band in EN 300 328

Evaluation of Rx Performance Degradation

Challenge: Check of Receiver Performance

The prokect department of R&S Asia in Singapur has developed a system solution for the test of TV sets.

Working with Save-and-Recall Files

(.savrcl Files)

Standard Scenario Interferer type Type of wanted signal

For Digital TV the interferer signal level has to be increased until the receiver provides with just sufficient performance.

The standard prescribes a minimum period of 15 seconds for the interval between two errors.

This leads to observation times of 30 seconds per interferer level value. The video must be seamless to avoid synchronisation errors of the device under test.

Tools for Field Strength and Power Discussion

Be careful:

Most tools allow the evaluation of power and fieldstrength conditions for „RMS“.

For active RF signal paths you need to consider the Peak-to-Average Power Ratio PAPR (→Crest Factor). Typical PAPR values can be derived from technical studies. A PAPR of 8 dB is often used for LTE signal types.

Field Strength and Power Discussion

Scenario

Separation distance.
Interferer signal EIRP at origin.
Expected fieldstrength of the „unwanted signal“ at the UUT (victim).

➔ Simulation by immunity system
Expected field strength at UUT.
Distance between UUT and antenna for the transmission of the unwanted signal. Antenna gain.

➔ RMS power level
Calculation of the transmit power level of the unwanted signal at the antenna input.

Additional Factors

- number of subcarriers
- Bandwidth correction e.g. in case of transient interferers.

Crest Factor, PAPR
Typical for LTE: 8 dB

Be careful:

Most tools allow the evaluation of power and fieldstrength conditions for „RMS“.

For active RF signal paths you need to consider the Peak-to-Average Power Ratio PAPR (→Crest Factor).

Typical PAPR values can be derived from technical studies.

A PAPR of 8 dB is often used for LTE signal types.

More details follow later.

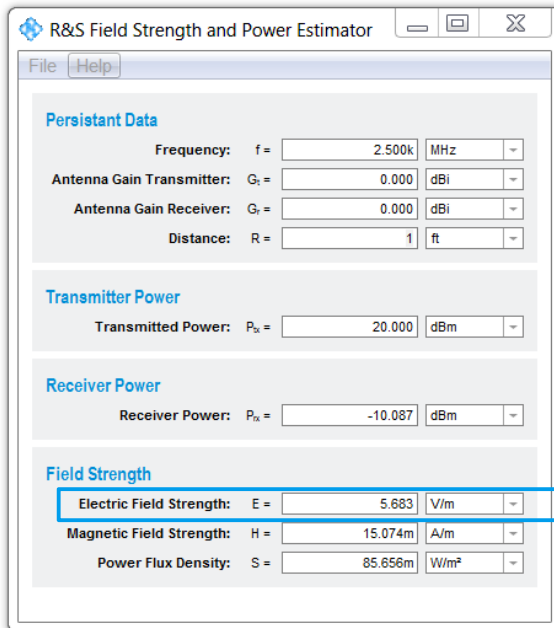

Tools for Field Strength and Power Discussion

Example

Scenario

Simulation by immunity system

RMS power level

Persistent Data

Frequency: f = 2.500k MHz

Antenna Gain Transmitter: G_t = 0.000 dBi

Antenna Gain Receiver: G_r = 0.000 dBi

Distance: R = 1 ft

Transmitter Power

Transmitted Power: P_x = 20.000 dBm

Receiver Power

Receiver Power: P_r = -10.087 dBm

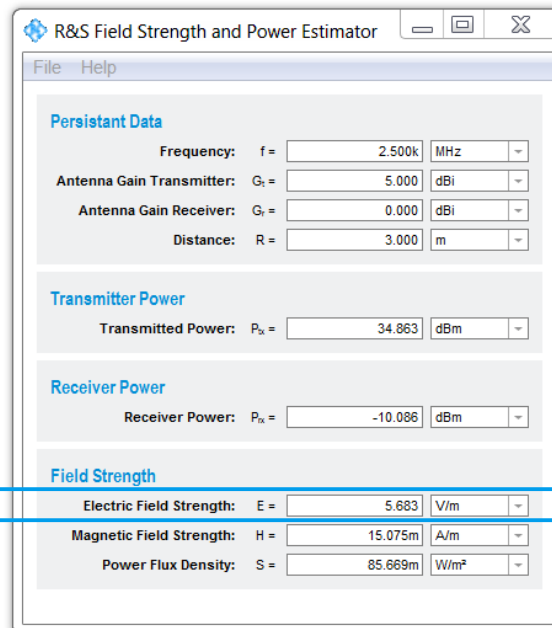

Field Strength

Electric Field Strength: E = 5.683 V/m

Magnetic Field Strength: H = 15.074m A/m

Power Flux Density: S = 85.656m W/m²

1 ft separation. EIRP (unwanted)
20 dBm at 2.5 GHz

Persistent Data

Frequency: f = 2.500k MHz

Antenna Gain Transmitter: G_t = 5.000 dBi

Antenna Gain Receiver: G_r = 0.000 dBi

Distance: R = 3.000 m

Transmitter Power

Transmitted Power: P_x = 34.863 dBm

Receiver Power

Receiver Power: P_r = -10.086 dBm

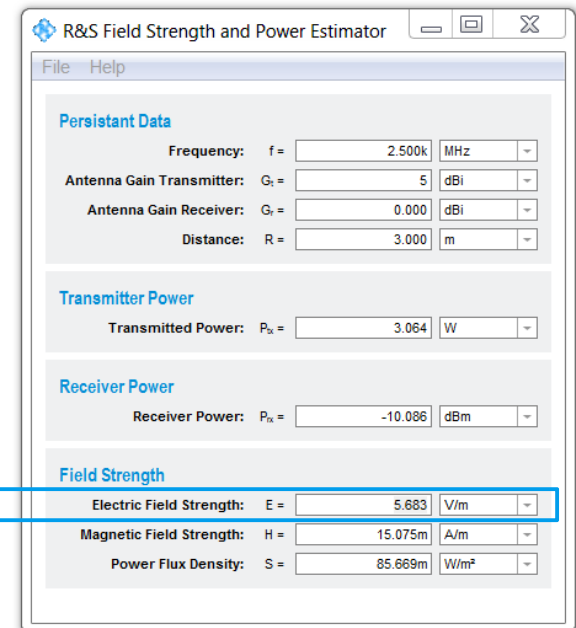

Field Strength

Electric Field Strength: E = 5.683 V/m

Magnetic Field Strength: H = 15.075m A/m

Power Flux Density: S = 85.669m W/m²

Keep the field strength. Put in the
setup parameter, e.g. 3 m. Gain 5 dBi.

Persistent Data

Frequency: f = 2.500k MHz

Antenna Gain Transmitter: G_t = 5 dBi

Antenna Gain Receiver: G_r = 0.000 dBi

Distance: R = 3.000 m

Transmitter Power

Transmitted Power: P_x = 3.064 W

Receiver Power

Receiver Power: P_r = -10.086 dBm

Field Strength

Electric Field Strength: E = 5.683 V/m

Magnetic Field Strength: H = 15.075m A/m

Power Flux Density: S = 85.669m W/m²

Required power for RMS: 3 Watt.
Additional head room to cope with the PAPR
of the unwanted signal: 8 dB → 19.3 Watt (net).
Losses of 1.5 dB? → 27.3 Watt → select 30 W.

Fieldstrength and Power Discussion

R&S Field Strength and Power Estimator

Application Note 1MA85

Persistent Data

Frequency: $f =$ GHz

Antenna Gain Transmitter: $G_t =$ dBi

Antenna Gain Receiver: $G_r =$ dBi

Distance: $R =$ m

Transmitter Power

Transmitted Power: $P_{tx} =$ W

Receiver Power

Receiver Power: $P_{rx} =$ μ W

Field Strength

Electric Field Strength: $E =$ V/m

Magnetic Field Strength: $H =$ A/m

Power Flux Density: $S =$ W/m²

Estimator Formulas

$$E^2 = Z_0 \cdot H^2$$
$$G \cdot \lambda^2 = \frac{4\pi}{3 \cdot 10^8 \frac{m}{s}}$$
$$= 120\pi = 377\Omega$$
$$= \text{Distance } R_x - T_x$$

Formula Explanation

f	Frequency
G_t	Antenna Gain Transmitter
G_r	Antenna Gain Receiver
R	Distance
P_{tx}	Transmitted Power
P_{rx}	Receiver Power
E	Electric Field Strength
H	Magnetic Field Strength
S	Power Flux Density
Z_0	Characteristic impedance of free space
c_0	Speed of light in vacuum
π	The mathematical constant
λ	Wavelength
A_e	Effective Area

Application Note 1MA85

Field Strength and Power Estimator Application Note

Determining the field strength from transmitted power is not an easy job. Various, quite complicated formulas have to be evaluated correctly. This application note explains how to calculate electric and magnetic field strength, and power flux density. A program associated with this application note helps with the calculation and converts Watts to mW and dBm, V/m to μV/m and dBμV/m as well as A/m to μA/m and dBμA/m. Additional applications are calculation of propagation loss or antenna factor. Smartphone versions of the application software are also available.

Note:
