For some measurement tasks, it is very convenient to have the measurement on the ZVL display and also on an external display. Requirement: The ZVL needs a DVI connector on the back. This FAQ explains the setup starting in spectrum analyzer mode. It also works in network analyzer mode.

1. Set the ZVL to Spectrum Analyzer mode.
2. On the ZVL, press
   SETUP -> General Setup -> More -> Open Start Menu
   and then select Settings -> Control Panel -> Display (as shown below).
3. Choose “Settings” and “Advanced”
4. Choose "Graphics Media .....".
5. Choose "Graphics Properties".
6. These are the original settings for the single display setup.
7. Change to multiple display mode.
8. Click OK. Do not wait more than 15 s or you will have to start again.
9. This is the final result.

Under some conditions you may encounter an “LXI message”. Just move it out of view. The settings are permanent, even after a power cycle. You can disconnect and reconnect the second display as often as you like.
